

WIX1002 Chapter 6 Revision

Method

- perform certain actions
 - one method one action
 - simplify the program and code reuse
 - method without return values
 - use void
 - method with return values
 - method is invoked by a method call
 - name of the method
 - correct argument values according to parameters sequence and type
 - a variable declared within a method is called a local variable
 - all the method invocation are call-by-value (except the reference type)
 - To define the method
- ```
accessSpecifier returnType methodName(parameterType parameterName,
...) {
 // Method body
}
```

### Parameters

- specified after the method name, inside the parentheses

### Arguments

- data you pass into the method's parameters

### Precondition

- states what is assumed to be true when the method is called

### Postcondition

- describes the effect of the method call
