

Reflection

After reading the lecture slides, visiting both links provided, and completing Chapter 2 and 3 in subgoals, I have learned a lot about the fundamentals of Java programming. I now have a better understanding of variables, constants, primitive data types, declaration and initialisation, which are really the foundation for writing any Java program. I also learned about type casting, which is useful when converting values between data types to avoid losing precision.

Besides that, I learnt about different types of operators including arithmetic operators, relational operators and logical operators. One thing that caught my attention was the difference between postfix and prefix operators. Postfix operators increase or decrease a variable's value after it has been used in an expression while prefix operators increase or decrease a variable's value before it has been used in an expression. It was interesting to see how a small change in their position could affect the order in which a variable's value increases or decreases.

Through this activity, I also realised how important it is to include comments in our code. It not only helps others understand what we are doing but also helps me remember my own logic when I look back later. Overall, this exercise really helped me build a stronger foundation and gave me more confidence to continue learning Java and other programming concepts in the future.
